

The future of education

Education is an endeavour for the senior community to transfer their knowledge to the younger members of our society. As technology rapidly progresses changing the world around us, it enables us to complete many tasks with just a click of a button. In some cases educators worry about losing their jobs, thinking that education will die out because of technology overtaking like artificial intelligence, commonly known as „AI“, however the need for education will never die out. Education is an essential prerequisite of modernization therefore it will evolve as had technology in the past centuries.

Travel is particularly an outstanding educational tool granting total immersion in a different culture. At the time that Greek travellers journeyed abroad exploring, bringing home customs from other cultures, today's people may engage in similar activities. Constantly decreasing prices of transport due to the competition between various carriers allows students to travel to places inaccessible to our ancestors, allowing them to pursue their careers or learning a possible number of languages.

Students will have more opportunities to educate themselves in different places and times, not just in classes. eLearning software facilitating opportunities for a more remote and unique way of learning. Theoretical parts of education will be learnt outside in parks, countryside, even with on-hand experience, because that is what careers demand these days, more creativity and experience, even though getting experience whilst studying is constantly hard and takes a lot of time. Learning outside of the classroom also has both mental and physical attributes.

One of the objectives of how to teach in the future is to inspire more creativity in education. Children should not just take in the information provided to them by teachers, but also share it and figure out what to do with it, the advantages, disadvantages and use their knowledge to lead a better, more meaningful life.

Technologies for example Google, Apple's Siri allows us access to information within seconds with just our voice. Time management will be one of the key factors and new technologies developing every day will help us to adapt more easily. Grades will depend on the student's initiative, creative-thinking and problem-solving. A subject like math will be a way of learning how to solve problems and puzzles and in literature students will express their feelings of a story they read.

Many public schools in the US already strive to bring the future into the present. A.C.T. Academy in McKinney received a grant of 5,5 million US dollars to achieve this goal and their mission is to „Identify the most effective teaching approaches, techniques and ideologies. Encourage innovations and their adaptation to specific circumstances. Assist the creation of a community of parents and teachers who support each other in improving schools.

Technology is the way to pave our way to a bright and a marvellous future. However technology does and will present a certain complication since most smart devices incorporate entertainment which to the students is a considerable distraction. Yet the will, the drive of the student is what makes them unique and even with a bad teacher, school, not enough material, if the student has the drive to become great he will achieve his maximum potential.
